# EXTREME AND SMOOTH POINTS IN LORENTZ AND MARCINKIEWICZ SPACES 

HAN JU LEE ${ }^{1}$,ANNA KAMIŃSKA ${ }^{2}$ AND GRZEGORZ LEWICKI ${ }^{3}$

IMUJ Preprint 2006/01

#### Abstract

We characterize extreme and smooth points in Lorentz sequence space $d(w, 1)$ and in Marcinkiewicz sequence spaces $d_{*}(w, 1)$ and $d^{*}(w, 1)$, which are predual and dual spaces to $d(w, 1)$, respectively. We then apply these characterizations for studying the relationship between the existence and one-complemented subspaces in $d(w, 1)$. We show that a subspace of $d(w, 1)$ is an existence set if and only if it is one-complemented.

Marcinkiewicz and Lorentz spaces play an important role in the theory of Banach spaces. They are key objects for instance in the interpolation theory of linear operators. The origins of the Marcinkiewicz spaces go back to the theorem on weak type operators [23, th. 2.b.15], which was originally due to K. Marcinkiewicz in the 1930-ties. The Lorentz spaces introduced by G.G. Lorentz in 1950, have appeared in a natural way as interpolation spaces between suitable Lebesgue spaces by classical result of Lions and Peetre [23, th. 2.g.18]. This theory has been developed very extensively thereafter and along with these investigations, the theory of Lorentz and Marcinkiewicz spaces, including the studies of their geometric structure, have been evolved independently (e.g. $[6,7,22,25])$. One can observe that these spaces find also applications in other topics of operator theory. It is worth to mention that Marcinkiewicz spaces $d^{*}(w, 1)$ have emerged recently many times in the context of norm-attaining linear operators. In the papers [1, 9, 14] it was shown among others, by using the space $d^{*}(w, 1)$ with specific weight, that the subspace of norm attaining operators is not always dense in the space of all bounded operators, contrary to the Bishop-Phelps theorem for linear functionals. For such types of isometric results the knowledge of geometric properties of the ball is of the utmost importance (see e.g. [9], where the characterization of complex convexity of the Lorentz spaces was the key factor in the proof of the main result).

In this paper we consider the Lorentz and Marcinkiewicz sequence spaces generated by decreasing weight sequences. In the first two sections we shall characterize the smooth and extreme points of the balls in these spaces. In the last section we shall apply these results to study the relationship between the existence and one-complemented subspaces of Lorentz sequence spaces.

Let's first agree on basic definitions and notations. Throughout the paper any vector space will be always considered over the field of real numbers $\mathbb{R}$. Given a Banach space $(X,\|\cdot\|)$, by $S_{X}$ and $B_{X}$ we denote the unit sphere and the unit ball of $X$, respectively. Recall that $x \in S_{X}$ is an extreme

[^0]point of the ball $B_{X}$ whenever $x=\left(x_{1}+x_{2}\right) / 2$ with $x_{i} \in S_{X}, i=1,2$, implies that $x=x_{1}=x_{2}$. An element $x \in X$ is called a smooth point of $X$ if there exists a unique bounded linear functional $\phi \in S_{X^{*}}$ such that $\phi(x)=\|x\|$. Such functional $\phi$ is a called a supporting functional of $x$.

A symbol ext $C$ will stand for the set of all extreme points of a convex subset $C$ of $X$.
Assume that $\{w(n)\}$ is a decreasing sequence of positive numbers such that $\lim _{n} w(n)=0$ and $\sum_{n=1}^{\infty} w(n)=\infty$. Let $W(n)=\sum_{i=1}^{n} w(i)$. By card $A$ we denote cardinality of $A \subset \mathbb{N}$. For a real sequence $x=\{x(n)\}$, by $x^{*}=\left\{x^{*}(n)\right\}$ we denote its decreasing rearrangement. Recall that $x^{*}(n)=\inf \left\{s>0: d_{x}(s) \leq n\right\}, n \in \mathbb{N}$, where $d_{x}$ is a distribution of $x$, that is $d_{x}(s)=\operatorname{card}\{k \in$ $\mathbb{N}:|x(k)|>s\}, s \geq 0$. For any $x=\{x(n)\}$ the support of $x$ is the set $\operatorname{supp} x=\{n \in \mathbb{N}: x(n) \neq 0\}$. We say that two sequences are equimeasurable whenever their distributions coincide. The Lorentz sequence space $d(w, 1)$ is a collection of all real sequences $x=\{x(n)\}$ such that

$$
\|x\|_{w, 1}=\sum_{n=1}^{\infty} x^{*}(n) w(n)<\infty
$$

It is well known that $d(w, 1)$ is a Banach space under the norm $\|\cdot\|_{w, 1}$. The Marcinkiewicz sequence space $d^{*}(w, 1)$ consists of all real sequences $x=\{x(n)\}$ satisfying

$$
\|x\|_{W}=\sup _{n} \frac{\sum_{i=1}^{n} x^{*}(i)}{W(n)}<\infty
$$

and the subspace $d_{*}(w, 1)$ of $d^{*}(w, 1)$ is defined as

$$
d_{*}(w, 1)=\left\{x \in d^{*}(w, 1): \lim _{n} \frac{\sum_{i=1}^{n} x^{*}(i)}{W(n)}=0\right\}
$$

Both spaces $d^{*}(w, 1)$ and $d_{*}(w, 1)$, equipped with the norm $\|\cdot\|_{W}$, are Banach spaces and $d_{*}(w, 1)$ is a closed subspace of $d^{*}(w, 1)$. It is well known that $d_{*}(w, 1)$ and $d^{*}(w, 1)$ are predual and dual spaces of $d(w, 1)$, respectively. Note also that by the assumptions on the weight $w$, each space $d(w, 1), d^{*}(w, 1)$ and $d_{*}(w, 1)$ is contained in the space $c_{0}$, and thus for any element $x$ in any of these spaces, the distribution function $d_{x}$ is always finite. For more details on the Lorentz and Marcinkiewicz spaces see e.g. ([19, 17, 22]).

## 1. Smooth points

In this section we characterize smooth points in Lorentz and Marcinkiewicz sequence spaces. We start with some auxiliary lemmas.
Lemma 1.1. Let $\phi=\{a(n)\} \in d(w, 1)$ be a supporting functional at $x \in S_{d^{*}(w, 1)}$. If there is $m \in \mathbb{N}$ such that

$$
\sum_{i=1}^{m} x^{*}(i)<W(m)
$$

then $a^{*}(m)=a^{*}(m+1)$.
Proof. Suppose, for a contrary that $a^{*}(m)>a^{*}(m+1)$. Since $x$ is an element of the unit sphere of $d^{*}(w, 1)$, we have $S^{*}(n):=\sum_{i=1}^{n} x^{*}(i) \leq W(n)$ for all $n \in \mathbb{N}$. Thus, in view of $S^{*}(m)<W(m)$ and by summation by parts, for every $l>m$,

$$
\begin{aligned}
& \sum_{i=1}^{l} a^{*}(i) x^{*}(i) \\
& \quad=\sum_{i=1}^{m}\left(a^{*}(i)-a^{*}(i+1)\right) S^{*}(i)+\sum_{i=m+1}^{l-1}\left(a^{*}(i)-a^{*}(i+1)\right) S^{*}(i)+a^{*}(l) S^{*}(l) \\
& \quad<\sum_{i=1}^{m}\left(a^{*}(i)-a^{*}(i+1)\right) W(i)+\sum_{i=m+1}^{l-1}\left(a^{*}(i+1)-a^{*}(i)\right) W(i)+a^{*}(l) W(l) \\
& \quad=\sum_{i=1}^{l} a^{*}(n) w(n)=\|\phi\|
\end{aligned}
$$

In view of

$$
\lim _{l} \sum_{i=m+1}^{l-1}\left(a^{*}(i)-a^{*}(i+1)\right) S^{*}(i) \leq \lim _{l} \sum_{i=m+1}^{l-1}\left(a^{*}(i+1)-a^{*}(i)\right) W(i)
$$

and

$$
\lim _{l} a^{*}(l) S^{*}(l) \leq \lim _{l} a^{*}(l) W(l)
$$

it follows that

$$
\begin{equation*}
\sum_{n=1}^{\infty} a^{*}(n) x^{*}(n)<\sum_{n=1}^{\infty} a^{*}(n) w(n)=\|\phi\| . \tag{1.1}
\end{equation*}
$$

Since $W$ is a supporting functional at $x$, applying the Hardy-Littlewood inequality, we obtain that

$$
\|\phi\|=\phi(x)=\sum_{n=1}^{\infty} a(n) x(n) \leq \sum_{n=1}^{\infty} a^{*}(n) x^{*}(n) .
$$

This is a contradiction to inequality (1.1) and the proof is done.
Corollary 1.2. Suppose $\phi=\{a(n)\} \in d(w, 1)$ is a supporting functional at $x \in S_{d_{*}(w, 1)}$. Then it is finite, i.e., $a(n) \neq 0$ for finite numbers of $n \in \mathbb{N}$.
Proof. In view of $x \in d_{*}(w, 1)$, there exists $N \in \mathbb{N}$ such that

$$
N=\max \left\{n: \frac{\sum_{i=1}^{n} x^{*}(i)}{W(n)}=1\right\}
$$

Then $\sum_{i=1}^{k} x^{*}(i)<W(k)$ for all $k>N$, and by Lemma 1.1, $a^{*}(N+1)=a^{*}(N+2)=\cdots=0$, since $\{a(n)\}$ is an element of $c_{0}$.

Proposition 1.3. If $x$ is an element of $S_{d^{*}(w, 1)}$ such that

$$
2 \leq \operatorname{card}\left\{m: \frac{\sum_{i=1}^{m} x^{*}(i)}{W(m)}=1\right\}<\infty
$$

then there exist two different norm-one supporting functionals in $d(w, 1)$ at $x$.
Proof. Let

$$
M=\max \left\{m: \frac{\sum_{i=1}^{m} x^{*}(i)}{W(m)}=1\right\}
$$

and suppose that $N<M$ such that

$$
\frac{\sum_{i=1}^{N} x^{*}(i)}{W(N)}=1=\frac{\sum_{i=1}^{M} x^{*}(i)}{W(M)} .
$$

Notice that

$$
x^{*}(M)=w(M)+\sum_{i=1}^{M-1}\left(w(i)-x^{*}(i)\right) \geq w(M) \geq w(M+1)
$$

Notice also that

$$
\sum_{i=1}^{M+1} x^{*}(i)<\sum_{i=1}^{M+1} w(i)
$$

So we have $x^{*}(M+1)<w(M+1)$. Therefore $x^{*}(M)>x^{*}(M+1)$. Hence there is a permutation $\sigma$ on $\mathbb{N}$ such that $|x(\sigma(k))|=x^{*}(k)$ for all $k=1, \ldots, M$. Now let for $y \in d^{*}(w, 1)$,

$$
\phi_{1}(y)=\frac{1}{W(N)} \sum_{i=1}^{N} \operatorname{sign}(x(\sigma(i)) y(\sigma(i))
$$

and

$$
\phi_{2}(y)=\frac{1}{W(M)} \sum_{i=1}^{M} \operatorname{sign}(x(\sigma(i)) y(\sigma(i))
$$

It is clear that $\phi_{1} \neq \phi_{2}, \phi_{1}(x)=\phi_{2}(x)=1$ and $\left\|\phi_{1}\right\|=\left\|\phi_{2}\right\|=1$. Thus $\phi_{1}$ and $\phi_{2}$ are two different norm-one supporting functionals in $d(w, 1)$ at $x$.

Proposition 1.4. Let $x$ be an element of $S_{d^{*}(w, 1)}$. If

$$
\operatorname{card}\left\{m: \frac{\sum_{i=1}^{m} x^{*}(i)}{W(m)}=1\right\}=1
$$

then there is a unique norm-one supporting functional $\psi$ in $d(w, 1)$ at $x$.
Proof. Suppose that

$$
\frac{\sum_{i=1}^{m} x^{*}(i)}{W(m)}=1
$$

holds for some $m \in \mathbb{N}$. Then $x^{*}(m)>x^{*}(m+1)$.
Let $\phi=\{a(n)\}$ be a norm-one supporting functional at $x$, where $\{a(n)\}$ is an element of $d(w, 1)$. Then by Lemma 1.1,

$$
a^{*}(1)=a^{*}(2)=\cdots=a^{*}(m)
$$

and

$$
a^{*}(m+1)=a^{*}(m+2)=\cdots=0
$$

Hence there is an increasing finite sequence $j_{1}<j_{2}<\cdots<j_{m}$ such that

$$
\phi(y)=\sum_{k=1}^{m} a \lambda_{k} y\left(j_{k}\right)
$$

where $a=a^{*}(1)$ and $\lambda_{k}= \pm 1$ for all $k=1, \ldots, m$. Since $\phi$ is a supporting functional at $x$,

$$
\|\phi\|=\sum_{k=1}^{m} a w(k)=\sum_{k=1}^{m} a \lambda_{k} x\left(j_{k}\right) \leq \sum_{k=1}^{m} a x^{*}(k)=\sum_{k=1}^{m} a w(k)=1 .
$$

This and the inequality $x^{*}(m)>x^{*}(m+1)$ imply that for $k=1, \ldots, m$,

$$
\lambda_{k} x\left(j_{k}\right)=x^{*}(k) \quad \text { and } \quad a=1 / W(n)
$$

Hence $\left|x\left(j_{k}\right)\right|=\lambda_{k} x\left(j_{k}\right)$ and so $\lambda_{k}=\operatorname{sign}\left(x\left(j_{k}\right)\right)$. Thus for $y \in d^{*}(w, 1)$,

$$
\phi(y)=\frac{1}{W(m)} \sum_{k=1}^{m} \operatorname{sign}\left(x\left(j_{k}\right)\right) y\left(j_{k}\right)
$$

On the other hand, there is a permutation $\pi$ on $\mathbb{N}$ such that $|x(\pi(k))|=x^{*}(k)$ for $k=1, \ldots, m$, because $x^{*}(m)>x^{*}(m+1)$. Then the linear functional $\psi$, defined by

$$
\psi(y)=\frac{1}{W(m)} \sum_{k=1}^{m} \operatorname{sign}(x(\pi(k))) y(\pi(k))
$$

is a norm-one supporting functional at $x$. Since $x^{*}(m)>x^{*}(m+1)$ and $|x(\pi(k))|=x^{*}(k)=\left|x\left(j_{k}\right)\right|$ for $k=1, \ldots, m$, so

$$
\{\pi(k): k=1, \ldots, m\}=\left\{j_{k}: k=1, \ldots, m\right\} .
$$

However it implies that $\phi=\psi$ and completes the proof.
Theorem 1.5. Let $x$ be an element of $S_{d_{*}(w, 1)}$. Then $x$ is a smooth point of $B_{d_{*}(w, 1)}$ if and only if

$$
\operatorname{card}\left\{m: \frac{\sum_{i=1}^{m} x^{*}(i)}{W(m)}=1\right\}=1
$$

Proof. The necessity follows from Proposition 1.4 and sufficiency from Proposition 1.3.

Since $d_{*}(w, 1)$ is $M$-embedded, so $\left(d^{*}(w, 1)\right)^{*}=d(w, 1) \oplus_{1} F$, where $F$ is the set of singular functionals. If $\xi \in F$ then it vanishes on $d_{*}(w, 1)([15,17])$.

Suppose that $\phi$ is a supporting functional at $x \in d^{*}(w, 1)$. Then it has a unique representation $\phi=\psi+\xi$, where $\psi=\{a(n)\} \in d(w, 1)$ and $\xi$ is a singular linear functional. By $M$-ideal property we have

$$
\|\phi\|=\|\psi\|+\|\xi\| \geq \psi(x)+\xi(x)=\phi(x)=\|\phi\| .
$$

Therefore, both $\psi$ and $\xi$ are supporting functionals at $x$.
Proposition 1.6. Let $x$ be an element of $S_{d^{*}(w, 1)}$. Suppose that

$$
\frac{\sum_{k=1}^{n} x^{*}(k)}{W(n)}<1
$$

holds for all $n \in \mathbb{N}$. Then a supporting functional $\phi$ at $x$ is singular.
Proof. Let $\phi=\psi+\xi$ be a unique decomposition, where $\psi=\{a(n)\}$ and $\xi$ is a singular linear functional. Then $\psi=\{a(n)\}$ is a supporting functional at $x$, and by Lemma 1.1, $a^{*}(1)=a^{*}(2)=$ $\cdots=0$. Thus $\psi=0$.

Proposition 1.7. Let $x$ be an element of $S_{d^{*}(w, 1)}$. If

$$
\limsup _{n} \frac{\sum_{k=1}^{n} x^{*}(k)}{W(n)}=1
$$

then there exist two different norm-one supporting functionals of $x$.
We need the following lemma.
Lemma 1.8. Let $x$ be an element of $S_{d^{*}(w, 1)}$. If

$$
\limsup _{n} \frac{\sum_{k=1}^{n} x^{*}(k)}{W(n)}=1,
$$

then there is a decomposition $x=x_{1}+x_{2}$ such that $\left|x_{1}\right| \wedge\left|x_{2}\right|=0$ and $\left\|x_{1}\right\|_{W}=\left\|x_{2}\right\|_{W}=1$.
Proof of Lemma. We shall use mathematical induction. There exists a nonempty finite subset $N_{1}$ of $\mathbb{N}$ such that $x(i) \neq 0$ for all $i \in N_{1}$ and

$$
\frac{\sum_{i \in N_{1}}|x(i)|}{W\left(\left|N_{1}\right|\right)} \geq\left(1-\frac{1}{2}\right) .
$$

Now suppose that there is a disjoint collection $\left\{N_{1}, \cdots, N_{m}\right\}$ of finite subsets of $\mathbb{N}$ such that $N_{k}$ is nonempty for all $k=1, \ldots, m$ and $x(i) \neq 0$ for all $i \in \bigcup_{k=1}^{m} N_{k}$ and for all $k=1, \ldots, m$,

$$
\frac{\sum_{i \in N_{k}}|x(i)|}{W\left(\left|N_{k}\right|\right)} \geq\left(1-\frac{1}{2^{k}}\right)
$$

Taking now $y=x \chi_{\mathbb{N} \backslash \bigcup_{k=1}^{m} N_{k}}$, we have

$$
1=\limsup _{n} \frac{\sum_{i=\max \left\{\bigcup_{k=1}^{m} N_{k}\right\}+1}^{n} x^{*}(i)}{W(n)} \leq \limsup _{n} \frac{\sum_{i=1}^{n} y^{*}(i)}{W(n)} \leq 1
$$

Thus there is a nonempty finite subset $N_{m+1}$ of $\mathbb{N} \backslash \bigcup_{k=1}^{m} N_{k}$ such that

$$
\frac{\sum_{i \in N_{m+1}}|x(i)|}{W\left(\left|N_{m+1}\right|\right)} \geq\left(1-\frac{1}{2^{m+1}}\right),
$$

which completes the induction process. Set now

$$
G_{1}=\bigcup_{k=1}^{\infty} N_{2 k-1} \cup\left(\mathbb{N} \backslash \bigcup_{k=1}^{\infty} N_{k}\right), \quad G_{2}=\bigcup_{k=1}^{\infty} N_{2 k}
$$

and $x_{1}=x \chi_{G_{1}}$ and $x_{2}=x \chi_{G_{2}}$. It is clear that $x=x_{1}+x_{2}$ and $\left|x_{1}\right| \wedge\left|x_{2}\right|=0$. Moreover,

$$
\frac{\sum_{i \in N_{2 m-1}}|x(i)|}{W\left(\left|N_{2 m-1}\right|\right)} \leq \frac{\sum_{k=1}^{\left|N_{2 m-1}\right|} x_{1}^{*}(k)}{W\left(\left|N_{2 m-1}\right|\right)} \leq 1
$$

and

$$
\frac{\sum_{i \in N_{2 m}}|x(i)|}{W\left(\left|N_{2 m}\right|\right)} \leq \frac{\sum_{k=1}^{\left|N_{2 m}\right|} x_{2}^{*}(k)}{W\left(\left|N_{2 m}\right|\right)} \leq 1
$$

hold for all $m$. This implies that $\left\|x_{1}\right\|_{W}=\left\|x_{2}\right\|_{W}=1$.
Proof of Proposition. Define a sublinear functional $q$ on $d^{*}(w, 1)$ as

$$
q(x)=\limsup _{n} \frac{\sum_{k=1}^{n} x^{*}(k)}{W(n)}
$$

for each $x \in d^{*}(w, 1)$. Now, set $p(x)=q\left(x^{+}\right)$. Then $p$ is also a sublinear functional satisfying $p(x) \leq\|x\|_{W}$ for all $x \in d^{*}(w, 1)$. By the previous lemma, there is a decomposition $x=x_{1}+x_{2}$ such that both $\left|x_{1}\right| \wedge\left|x_{2}\right|=0$ and $\left\|x_{1}\right\|_{W}=\left\|x_{2}\right\|_{W}=1$ hold.

Define a linear functional $\phi_{1}$ so that $\phi_{1}\left(\lambda\left|x_{1}\right|\right)=\lambda$ on $\operatorname{span}\left\{\left|x_{1}\right|\right\}$, where $\lambda \in \mathbb{R}$. Then $\phi_{1}(y) \leq$ $p(y)$ on span $\left\{\left|x_{1}\right|\right\}$. Applying now the Hahn-Banach extension theorem, there is an extension $\phi_{1}$ to $d^{*}(w, 1)$ such that $\phi_{1}(x) \leq p(x)$ holds for all $x \in d^{*}(w, 1)$. Then $\phi_{1}$ is a positive linear functional with norm one. Indeed, for each $x \in d^{*}(w, 1)$ with $x \geq 0$,

$$
-\phi_{1}(x)=\phi_{1}(-x) \leq p(-x)=q\left((-x)^{+}\right)=q(0)=0
$$

and so $\phi_{1}(x) \geq 0$. Hence

$$
\left|\phi_{1}(x)\right| \leq \phi_{1}(|x|) \leq p(|x|) \leq\|x\|_{W} .
$$

Notice also that $\phi_{1}\left(\left|x_{1}\right|\right)=1$.
Similarly, we can obtain a positive linear functional $\phi_{2}$ on $d^{*}(w, 1)$ satisfying $\left\|\phi_{2}\right\|=1$ and $\phi_{2}\left(\left|x_{2}\right|\right)=1$.

Then for each $i=1,2$,

$$
1=\phi_{i}\left(\left|x_{i}\right|\right) \leq \phi_{i}\left(\left|x_{1}\right|\right)+\phi_{i}\left(\left|x_{2}\right|\right)=\phi_{i}(|x|) \leq 1
$$

which implies that $\phi_{i}\left(\left|x_{j}\right|\right)=\delta_{i}(j)$, where $\delta_{i}$ is a Dirac-delta function at $i=1,2$, and $\phi_{i}(|x|)=1$ for $i=1,2$. Define an isometry $T$ on $d^{*}(w, 1)$ as

$$
T y=\{\operatorname{sign}(x(n)) y(n)\}_{n=1}^{\infty}
$$

for each $y \in d^{*}(w, 1)$. Letting now $\psi_{i}=\phi_{1} \circ T, i=1,2$, we obtain two different norm-one supporting functionals at $x$, which finishes the proof.

Theorem 1.9. An element $x$ in $S_{d^{*}(w, 1)}$ is a smooth point of $B_{d^{*}(w, 1)}$ if and only if there is $m \in \mathbb{N}$ such that

$$
\frac{\sum_{k=1}^{m} x^{*}(k)}{W(m)}=1>\sup _{n \neq m}\left\{\frac{\sum_{k=1}^{n} x^{*}(k)}{W(n)}\right\}
$$

Proof. The necessity follows from Propositions 1.3 and 1.7. In order to show the sufficiency, suppose the inequality in the hypothesis is satisfied. Then $x^{*}(m)>x^{*}(m+1)$ and there exists a permutation $\sigma$ on $\mathbb{N}$ such that $|x(\sigma(k))|=x^{*}(k)$ for $k=1, \ldots, m$. Let $\phi=\psi+\xi$ be a norm-one supporting functional at $x$, where $\psi \in d(w, 1)$ and $\xi$ is singular. Setting if $\xi \neq 0$, then

$$
t=\max \{\sigma(k): k=1, \ldots, m\}
$$

it is clear that $\left\|x \chi_{\mathbb{N} \backslash\{1, \ldots, t\}}\right\|_{W}<1$. Therefore

$$
\|\xi\|=\xi(x)=\xi\left(x \chi_{\mathbb{N} \backslash\{1, \ldots, t\}}\right)<\|\xi\|
$$

and so it is a contradiction. Hence $\xi=0$. By Proposition 1.4, norm-one supporting functional $\psi \in d(w, 1)$ at $x$ is unique, and the proof is done.

Below we provide a characterization of smooth points in the Lorentz space $d(w, 1)$.
Theorem 1.10. An element $x$ of the unit sphere of $d(w, 1)$ is a smooth point if and only if $\operatorname{supp} x$ is infinite and the following condition is satisfied:

$$
\begin{equation*}
\text { Whenever there is } k \geq 1 \text { such that } w(k)>w(k+1) \text {, we get } x^{*}(k)>x^{*}(k+1) \text {. } \tag{1.2}
\end{equation*}
$$

Proof. We shall show first the necessity. It is easy to see that if $\operatorname{supp} x$ is finite, then there are infinitely many supporting functionals at $x$. Thus assume that supp $x$ is infinite. We shall show that if $x^{*}\left(k_{0}\right)=x^{*}\left(k_{0}+1\right)$ and $w\left(k_{0}\right)>w\left(k_{0}+1\right)$ for some $k_{0} \in \mathbb{N}$, then we can obtain two different supporting functionals at $x$. It well known that there is a $1-1$ and onto mapping $\sigma: \mathbb{N} \rightarrow \operatorname{supp} x$ such that $x^{*}=|x \circ \sigma|$. Choose two sequences $y_{1}$ and $y_{2}$ defined by

$$
\begin{aligned}
& y_{1}= \begin{cases}\operatorname{sign}(x(k)) \cdot w\left(\sigma^{-1}(k)\right), & \text { for } k \in \operatorname{supp} x \\
0, & \text { otherwise },\end{cases} \\
& y_{2}= \begin{cases}y_{1}(k), & k \neq \sigma\left(k_{0}\right) \text { and } k \neq \sigma\left(k_{0}+1\right) \\
\operatorname{sign}\left(x\left(\sigma\left(k_{0}\right)\right)\right) \cdot \frac{w\left(k_{0}\right)+w\left(k_{0}+1\right)}{}, & k=\sigma\left(k_{0}\right) ; \\
\operatorname{sign}\left(x\left(\sigma\left(k_{0}+1\right)\right)\right) \cdot \frac{w\left(k_{0}\right)+w\left(k_{0}+1\right)}{2}, & k=\sigma\left(k_{0}+1\right) .\end{cases}
\end{aligned}
$$

Notice that $\left\|y_{1}\right\|_{W}=\left\|y_{2}\right\|_{W}=1$. It is also easy to check that $y_{1}$ and $y_{2}$ are two different supporting functionals at $x$.

Now let $x \in S_{d(w, 1)}$ satisfy condition (1.2) and let $y \in S_{d^{*}(w, 1)}$ be a supporting functional of $x$. Then

$$
1=\sum_{k=1}^{\infty} x(k) y(k)=\sum_{k=1}^{\infty} \operatorname{sign}(x(\sigma(k))) \cdot x^{*}(k) y(\sigma(k)),
$$

where $x^{*}=|x \circ \sigma|$. Taking $S(n)=\sum_{k=1}^{n} \operatorname{sign}(x(\sigma(k))) \cdot y(\sigma(k))$ and $S^{\prime}(n)=\sum_{k=1}^{n} y^{*}(k)$ we have $S(n) \leq S^{\prime}(n) \leq W(n)$ for every $n \in \mathbb{N}$, in view of the Hardy-Littlewood inequality and $\|y\|_{W}=1$. We shall show by induction that for every $n \in \mathbb{N}$,

$$
y(\sigma(n))=\operatorname{sign}(x(\sigma(n))) \cdot y^{*}(n)=\operatorname{sign}(x(\sigma(n))) \cdot w(n)
$$

Since $\lim _{n \rightarrow \infty} x^{*}(n)=0$, there is $m$ such that $m=\max \left\{k \geq 1: x^{*}(1)=x^{*}(k)\right\}$. If $S(m)<W(m)$, then by the summation by parts, we get

$$
\begin{align*}
1 & =\sum_{i=1}^{\infty} x^{*}(i) y(\sigma(i)) \operatorname{sign}(x(\sigma(i)))  \tag{1.3}\\
& =\sum_{i=1}^{m}\left(x^{*}(i)-x^{*}(i+1)\right) S(i)+\lim _{l \rightarrow \infty}\left\{\sum_{i=m+1}^{l-1}\left(x^{*}(i)-x^{*}(i+1)\right) S(i)+x^{*}(l) S(l)\right\} \\
& <\sum_{i=1}^{m}\left(x^{*}(i)-x^{*}(i+1)\right) W(i)+\lim _{l \rightarrow \infty}\left\{\sum_{i=m+1}^{l-1}\left(x^{*}(i)-x^{*}(i+1)\right) W(i)+x^{*}(l) W(l)\right\} \\
& =\sum_{i=1}^{\infty} x^{*}(i) w(i)=1
\end{align*}
$$

which is a contradiction. So $S(m)=W(m)$. Notice that $\sup _{k}|y(k)| \leq y^{*}(1) \leq w(1)$. Since $x^{*}(i)=x^{*}(j)$ for every $1 \leq i, j \leq m$, we also have $w(1)=\cdots=w(m)$ by the assumption (1.2). This and $S(m) \leq S^{\prime}(m) \leq W(m)$ imply that

$$
S(m)=S^{\prime}(m)=W(m)=m \cdot w(1)
$$

and $\operatorname{sign}(x(\sigma(k))) \cdot y(\sigma(k))=y^{*}(k)=w(k)$ for $k=1, \ldots, m$. Hence

$$
y(\sigma(1))=\operatorname{sign}(x(\sigma(1))) \cdot y^{*}(1)=\operatorname{sign}(x(\sigma(1)) w(1) .
$$

For the inductive step assume that for every $k \leq n$, we have

$$
y(\sigma(k))=\operatorname{sign}(x(\sigma(k))) \cdot y^{*}(k)=\operatorname{sign}(x(\sigma(k))) \cdot w(k) .
$$

Let now $m=\max \left\{k \geq n+1: x^{*}(n+1)=x^{*}(k)\right\}$. If $S(m)<W(m)$, then the inequality (1.3) yields a contradiction, and so $S(m)=W(m)$. By the induction hypothesis and by (1.2), we get $S(m)-S(n)=W(m)-W(n)=(m-n) w(n+1)$ and $w(n+1) \geq \sup _{j \geq n+1}|y(\sigma(j))|=$ $\sup _{j \geq n+1} y^{*}(j)$. Thus for $n+1 \leq j \leq m$

$$
y(\sigma(j))=\operatorname{sign}(x(\sigma(j))) \cdot y^{*}(j)=\operatorname{sign}(x(\sigma(j))) \cdot w(j)
$$

This completes the induction and the uniqueness of the supporting functional at $x$ has been proved.

## 2. Extreme points

A Banach space $(X,\|\cdot\|)$, a collection of real sequences, is said to be a r.i. sequence space if for any $x=\{x(n)\} \in X$ we have $\|x\|=\left\|x^{*}\right\|$, and for any $y=\{y(n)\}$ such that $|y(n)| \leq|x(n)|$ for every $n \in \mathbb{N}$, we have that $y \in X$ and $\|y\| \leq\|x\|$. It is clear that all spaces $d(w, 1), d^{*}(w, 1)$ and $d_{*}(w, 1)$ are r.i. sequence spaces.
Proposition 2.1. Let $(X,\|\cdot\|)$ be a r.i. sequence space and $x \in S_{X}$ be such that its distribution $d_{x}$ is a finite valued function.
(i) If $\sup x$ is finite or equal to $\mathbb{N}$, then $x$ is an extreme point of $B_{X}$ if and only if $x^{*}$ is an extreme point.
(ii) If $x$ is an extreme point of $B_{X}$, then $x^{*}$ is also an extreme point of $B_{X}$. If in addition $X$ is strictly monotone, then the converse statement is also satisfied.

Proof. Since $d_{x}(\theta)<\infty$ for all $\theta>0, \lim _{n} x^{*}(n)=0$ and there exists a $1-1$ and onto mapping $\sigma: \mathbb{N} \rightarrow \operatorname{supp} x$ such that for all $n \in \mathbb{N}$,

$$
\begin{equation*}
x^{*}(n)=|x(\sigma(n))|=\lambda_{n} x(\sigma(n)) \tag{2.1}
\end{equation*}
$$

where $\lambda_{n}=\operatorname{sign} x(\sigma(n))$.
(i). Under the assumptions, $\sigma$ is a permutation of $\mathbb{N}$, and then the operator

$$
T y(n)=\lambda_{n} y(\sigma(n)), \quad y \in X
$$

is an isometry on $X$ such that $T x=x^{*}$. We get the conclusion immediately since $T$ preserves extreme points.
(ii). Suppose $x^{*} \in S_{X}$ is not an extreme point of $B_{X}$. Then there exist $y, z \in S_{X}$ such that $y \neq z$ and $x^{*}=(y+z) / 2$. Hence

$$
x(\sigma(n))=\frac{\lambda_{n} y(n)+\lambda_{n} z(n)}{2}
$$

and so we get for every $n \in \operatorname{supp} x$,

$$
x(n)=\frac{\beta_{n} y\left(\sigma^{-1}(n)\right)+\beta_{n} z\left(\sigma^{-1}(n)\right)}{2}
$$

where $\sigma^{-1}: \operatorname{supp} x \rightarrow \mathbb{N}$ is 1-1 and onto mapping and $\beta_{n}=\operatorname{sign} x(n)$. Thus setting

$$
\begin{aligned}
& \bar{y}(n)= \begin{cases}\beta_{n} y\left(\sigma^{-1}(n)\right), & n \in \operatorname{supp} x \\
0, & \text { otherwise }\end{cases} \\
& \bar{z}(n)= \begin{cases}\beta_{n} z\left(\sigma^{-1}(n)\right), & n \in \operatorname{supp} x \\
0, & \text { otherwise }\end{cases}
\end{aligned}
$$

we have that $\bar{y}$ and $\bar{z}$ are equimeasurable with $y$ and $z$, respectively. Hence $\|x\|=\|\bar{y}\|=\|\bar{z}\|$. Moreover, $x=(\bar{y}+\bar{z}) / 2$ and $\bar{y} \neq \bar{z}$, since there exists $m \in \operatorname{supp} x$ such that $y\left(\sigma^{-1}(m)\right) \neq z\left(\sigma^{-1}(m)\right)$ by the assumption that $y \neq z$. Thus $x$ is not extreme point of $B_{X}$ as well.

Suppose now that $X$ is strictly monotone, and let $x$ be not extreme point of $B_{X}$. Then there exist $y, z \in S_{X}$ such that $y \neq z$, and for all $n \in \mathbb{N}$,

$$
x(n)=\frac{y(n)+z(n)}{2} .
$$

It follows that supp $y \cup \operatorname{supp} z \subset \operatorname{supp} x$. Indeed, if there is $m \in \mathbb{N}$ such that $x(m)=0$ and $y(m) \neq 0$, then $z(m) \neq 0$ and setting $\tilde{y}=y \chi_{\operatorname{supp} x}$ and $\tilde{z}=z \chi_{\operatorname{supp} x}$, we have $\|\tilde{y}\|<\|y\|$ and $\|\tilde{z}\|<\|z\|$, by strict monotonicity of $X$. However, $x=(\tilde{y}+\tilde{z}) / 2$ and so $\|x\| \leq(\|\tilde{y}\|+\|\tilde{z}\|) / 2<(\|y\|+\|z\|) / 2=\|x\|$; a contradiction.

By (2.1), for all $n \in \mathbb{N}$,

$$
x^{*}(n)=\frac{\lambda_{n} y(\sigma(n))+\lambda_{n} z(\sigma(n))}{2}
$$

Since supports of $y$ and $z$ are included in $\operatorname{supp} x,|y \circ \sigma|$ and $|z \circ \sigma|$ are equimeasurable with $y$ and $z$, respectively. It is also clear that they are different. Thus taking $y_{0}(n)=\lambda_{n} y(\sigma(n))$ and $z_{0}(n)=\lambda_{n} z(\sigma(n))$ we have that $\left\|y_{0}\right\|=\left\|z_{0}\right\|=1, y_{0} \neq z_{0}$, and $x^{*}=\left(y_{0}+z_{0}\right) / 2$. Thus $x^{*}$ is not an extreme point, which completes the proof.

Theorem 2.2. An element $x \in S_{d^{*}(w, 1)}$ is an extreme point of $B_{d^{*}(w, 1)}$ if and only if $x^{*}=w$.
Proof. Recall that whenever $x \in d^{*}(w, 1)$ then $d_{x}(\theta)<\infty$ for every $\theta>0$. Assume that $x^{*} \neq w$, where $\|x\|_{W}=1$. In view of Proposition 2.1 (ii) it is enough to show that if $x^{*}$ is an extreme point, then $x^{*}=w$. We shall prove it by use of induction. Suppose, on the contrary, that $x^{*}(1)<w(1)$. We have three possible cases.

Case (1). Suppose first that $x^{*}(1)>x^{*}(2)>x^{*}(3)$ holds. Then choose an $\epsilon>0$ such that $x^{*}(1)+\epsilon<w(1)$

$$
\begin{gathered}
x^{*}(1)+\epsilon>x^{*}(2)-\epsilon>x^{*}(3), \text { and } \\
x^{*}(1)-\epsilon>x^{*}(2)+\epsilon>x^{*}(3) .
\end{gathered}
$$

Then by setting

$$
\begin{aligned}
y & =\left(x^{*}(1)+\epsilon, x^{*}(2)-\epsilon, x^{*}(3), \ldots\right) \text { and } \\
& z=\left(x^{*}(1)-\epsilon, x^{*}(2)+\epsilon, x^{*}(3), \ldots\right),
\end{aligned}
$$

it is easy to see that $\|y\|_{W},\|z\|_{W} \leq 1$ and $x^{*}=\frac{y+z}{2}$ hold. Hence it is a contradiction to the fact that $x^{*}$ is an extreme point.

Case (2). Suppose that $x^{*}(1)=x^{*}(2)=\cdots=x^{*}(m)>x^{*}(m+1)$ for some $m \geq 2$. Then for every $1 \leq k<m$,

$$
k x^{*}(k)<w(1)+\cdots+w(k)
$$

Indeed, if $k x^{*}(1)=w(1)+\cdots+w(k)$ for some $1 \leq k<m$, then $w(k)<x^{*}(1)$. Hence

$$
m x^{*}(1)=w(1)+\cdots+w(k)+(m-k) x^{*}(1)>w(1)+\cdots+w(m)
$$

which is a contradiction to the fact that $\|x\|_{W}=1$.
Now choose $\epsilon>0$ such that $(m-1) x^{*}(1)+\epsilon<w(1)+\cdots+w(m-1)$ and $x^{*}(1)-\epsilon>x^{*}(m+1)$ hold. Setting

$$
\begin{aligned}
& y=\left(x^{*}(1)+\epsilon, x^{*}(1), \ldots, x^{*}(1)-\epsilon, x^{*}(m+1), \ldots\right) \\
& z=\left(x^{*}(1)-\epsilon, x^{*}(1), \ldots, x^{*}(1)+\epsilon, x^{*}(m+1), \ldots\right)
\end{aligned}
$$

Then it is easy to see that $\|y\|_{W}=\|z\|_{W} \leq 1$ and $x^{*}=\frac{y+z}{2}$. This is also a contradiction.
Case (3). Suppose that $x^{*}(1)>x^{*}(2)=x^{*}(3)=\cdots=x^{*}(m)>x^{*}(m+1)$ for some $m \geq 3$. Then it is easy to see that for $1 \leq k<m$,

$$
x^{*}(1)+(k-1) x^{*}(2)<w(1)+\cdots+w(k) .
$$

Indeed, if $x^{*}(1)+(k-1) x^{*}(2)=w(1)+\cdots+w(k)$ for some $2 \leq k<m$, then $(k-1) x^{*}(2) \geq$ $w(1)-x^{*}(1)+(k-1) w(k)>(k-1) w(k)$. That is, $x^{*}(2)>w(k)$. Hence

$$
\begin{aligned}
x^{*}(1)+(m-1) x^{*}(2) & =w(1)+\cdots+w(k)+(m-k) x^{*}(2) \\
& >w(1)+\cdots+w(k)+w(k+1)+\cdots+w(m) .
\end{aligned}
$$

It is impossible since $x^{*}$ has norm one.
Then choose $\epsilon>0$ such that $x^{*}(1)>x^{*}(2)+\epsilon, x^{*}(2)-\epsilon>x^{*}(m+1)$ and

$$
x^{*}(1)+(m-2) x^{*}(2)+\epsilon<w(1)+\cdots+w(m-1) .
$$

Letting

$$
\begin{gathered}
y=\left(x^{*}(1), x^{*}(2)+\epsilon, \ldots, x^{*}(2)-\epsilon, x^{*}(m+1), \ldots\right), \text { and } \\
z=\left(x^{*}(1), x^{*}(2)-\epsilon, \ldots, x^{*}(2)+\epsilon, x^{*}(m+1), \ldots\right),
\end{gathered}
$$

Then $\|y\|_{W}=\|z\|_{W} \leq 1$ and $x^{*}=\frac{y+z}{2}$, which is impossible since $x^{*}$ is an extreme point.
Therefore, we show that $x^{*}(1)=w(1)$. For the use of induction, suppose that $x^{*}(k)=w(k)$ for $1 \leq k \leq n$. If $x^{*}(n+1)<w(n+1)$, then exactly same argument for cases (1), (2) and (3), shows that it is a contradiction. Hence, $x^{*}(n+1)=w(n+1)$. Therefore if $x^{*}$ is an extreme point, then $x^{*}=w$.

Now we show that $x$ is an extreme point of the unit ball of $d^{*}(w, 1)$ if $x^{*}=w$. Let $A=\operatorname{supp} x$ and $\beta: A \rightarrow A$ be a 1-1 and onto mapping such that the sequence $\{|x(\beta(n))|\}$ is decreasing on $A$
that is $|x(\beta(j))| \leq|x(\beta(i))|$ whenever $i<j$. Consider $\gamma: \mathbb{N} \rightarrow \mathbb{N}$ defined as $\gamma(n)=\beta(n)$ for $n \in A$ and $\gamma(n)=n$ for $n \notin A$. Then

$$
(T y)(n)=\operatorname{sign} x(\gamma(n)) y(\gamma(n))
$$

is a linear isometry on $d^{*}(w, 1)$ such that

$$
(T x)(n)=|x(\gamma(n))| .
$$

Hence $x$ is an extreme point whenever $|x \circ \gamma|$ is an extreme point. In view of that we can assume that $x \in S_{d^{*}(w, 1)}$ is non-negative, decreasing whenever restricted to its support $A$, and $x^{*}=w$. Now let $y, z \in S_{d^{*}(w, 1)}$ be such that for all $n \in \mathbb{N}$,

$$
x(n)=\frac{y(n)+z(n)}{2} .
$$

In view of the assumptions on $x$, letting $A=\left\{n_{1}, n_{2}, \ldots\right\}$, where $n_{1}<n_{2}<\ldots$, we have

$$
x\left(n_{k}\right)=w(k), \quad k \in \mathbb{N} .
$$

We shall show first that

$$
y\left(n_{k}\right)=z\left(n_{k}\right)=x\left(n_{k}\right), \quad k \in \mathbb{N}
$$

Let further

$$
\tilde{y}=y \chi_{A} \quad \text { and } \quad \tilde{z}=z \chi_{A} .
$$

We shall apply mathematical induction. Let $n=n_{1}$. Assuming that $\left|y\left(n_{1}\right)\right| / w(1)>1$ we get a contradiction since

$$
1 \geq \frac{\tilde{y}^{*}(1)}{w(1)} \geq \frac{\left|y\left(n_{1}\right)\right|}{w(1)}>1
$$

Thus $\left|y\left(n_{1}\right)\right| \leq w(1)$ and similarly $\left|z\left(n_{1}\right)\right| \leq w(1)$. Then $y\left(n_{1}\right)=z\left(n_{1}\right)=w(1)=x\left(n_{1}\right)$. Notice also that we have $\tilde{y}^{*}(1)=y\left(n_{1}\right)=\tilde{z}^{*}(1)=z\left(n_{1}\right)$. Assume now that

$$
\tilde{y}^{*}(i)=y\left(n_{i}\right)=w(i)=z\left(n_{i}\right)=\tilde{z}^{*}(i)
$$

for all $i=1, \ldots, m$ and some $m>1$. Then

$$
\frac{\sum_{i=1}^{m+1} \tilde{y}^{*}(i)}{W(m+1)}=\frac{\sum_{i=1}^{m} w(i)+\tilde{y}^{*}(m+1)}{W(m+1)} \leq 1
$$

and so $\tilde{y}^{*}(m+1) \leq w(m+1)$. Hence for all $i \geq m+1$,

$$
\tilde{y}^{*}(i) \leq w(m+1)
$$

and since there exists $j \geq m+1$ such that $\tilde{y}^{*}(j)=y\left(n_{m+1}\right)$, we have

$$
\left|y\left(n_{m+1}\right)\right| \leq w(m+1)
$$

Analogously we can show that

$$
\left|z\left(n_{m+1}\right)\right| \leq w(m+1)
$$

and so

$$
\tilde{y}^{*}(m+1)=y\left(n_{m+1}\right)=z\left(n_{m+1}\right)=\tilde{z}^{*}(m+1)=w(m+1)=x\left(n_{m+1}\right)
$$

This completes the induction. It remains to show that $y(i)=z(i)=0$ for all $i \notin A$. Notice that $\tilde{y}^{*} \leq y^{*}$ and we have for every $n \geq 1$,

$$
1 \geq \frac{\sum_{i=1}^{n} y^{*}(i)}{W(n)} \geq \frac{\sum_{i=1}^{n} \tilde{y}^{*}(i)}{W(n)}=1
$$

Hence $\tilde{y}^{*}=y^{*}$ and in view of $\lim _{n} y^{*}(n)=0$ we have $y(i)=0$. Similarly $z(i)=0$ for every $i \notin A$.

Remark 2.3. The extreme points for the unit ball of finite dimensional Marcinkiewicz sequence spaces are characterized in [8].
Lemma 2.4. The Lorentz space $d(w, 1)$ is strictly monotone.
Proof. If $x<y, x, y \in d(w, 1)$, then $x^{*} \leq y^{*}$ and there exists $m \in \mathbb{N}$ such that $x^{*}(m)<y^{*}(m)$. This results from the simple fact that $d_{y}$ is finite. It follows that $\|x\|_{w, 1}<\|y\|_{w, 1}$.

The next result follows immediately from Proposition 2.1 and Lemma 2.4.
Corollary 2.5. An element $x \in S_{d(w, 1)}$ is extreme point of the ball $B_{d(w, 1)}$ if and only if $x^{*}$ is an extreme point of $B_{d(w, 1)}$.

Theorem 2.6. An element $x \in S_{d(w, 1)}$ is extreme point of the ball $B_{d(w, 1)}$ if and only if there exists $n_{0} \in \mathbb{N}$ such that $x^{*}(i)=1 / W\left(n_{0}\right)$ for $i=1, \ldots, n_{0}, x^{*}(i)=0$ for $i>n_{0}$ and $w(1)>w\left(n_{0}\right)$, provided $n_{0}>1$.

Proof. In view of Corollary 2.5 we assume that $x=x^{*}$. Suppose first that $x \in S_{d(w, 1)}$ is an extreme point of $B_{d(w, 1)}$ and let

$$
n_{0}=\sup \{n \in \mathbb{N}: x(n)=x(1)\}
$$

Since $d(w, 1) \subset c_{0}$, it is clear that $n_{0} \in \mathbb{N}$. We shall show that $x\left(n_{0}+1\right)=0$. Let for a contrary $x\left(n_{0}+1\right)>0$ and set

$$
n_{1}=\max \left\{n \in \mathbb{N}: x(n)=x\left(n_{0}+1\right)\right\}
$$

Setting $d=\min \left\{x(1)-x\left(n_{0}+1\right), x\left(n_{0}+1\right)-x\left(n_{1}+1\right)\right\}$, we have $d>0$. Fix $b>0$ such that

$$
b\left(1+\frac{W\left(n_{0}\right)}{W\left(n_{1}\right)-W\left(n_{0}\right)}\right)<d
$$

Define

$$
\begin{aligned}
y= & \left(x(1)-b, \ldots, x\left(n_{0}\right)-b, x\left(n_{0}+1\right)+\frac{b W\left(n_{0}\right)}{W\left(n_{1}\right)-W\left(n_{0}\right)}, \ldots,\right. \\
& \left.x\left(n_{1}\right)+\frac{b W\left(n_{0}\right)}{W\left(n_{1}\right)-W\left(n_{0}\right)}, x\left(n_{1}+1\right), x\left(n_{1}+2\right) \ldots\right)
\end{aligned}
$$

and

$$
\begin{aligned}
z= & \left(x(1)+b, \ldots, x\left(n_{0}\right)+b, x\left(n_{0}+1\right)-\frac{b W\left(n_{0}\right)}{W\left(n_{1}\right)-W\left(n_{0}\right)}, \ldots,\right. \\
& \left.x\left(n_{1}\right)-\frac{b W\left(n_{0}\right)}{W\left(n_{1}\right)-W\left(n_{0}\right)}, x\left(n_{1}+1\right), x\left(n_{1}+2\right) \ldots\right) .
\end{aligned}
$$

Note that $y \neq z$ and $x=(y+z) / 2$. By the choice of $b$ and $d, y=y^{*}$ and $z=z^{*}$. Hence

$$
\begin{aligned}
\|y\|_{w, 1} & =\sum_{j=1}^{\infty} y(j) w(j)=\sum_{j=1}^{\infty} x(j) w(j)-b W\left(n_{0}\right)+\frac{b W\left(n_{0}\right)}{W\left(n_{1}\right)-W\left(n_{0}\right)} \sum_{j=n_{o}+1}^{n_{1}} w(j) \\
& =\sum_{j=1}^{\infty} x(j) w(j)=1 .
\end{aligned}
$$

Analogously, we can show that $\|z\|_{w, 1}=1$. It contradicts the assumption that $x$ is an extreme point and consequently $x\left(n_{0}+1\right)=0$, as required. If $n_{0}>1$ and $w(1)=w\left(n_{0}\right)$, define for $0<b<x(1)$,

$$
y_{b}=\left(x(1)+b, x(2), \ldots, x\left(n_{0}-1\right), x\left(n_{0}\right)-b, x\left(n_{0}+1\right), \ldots\right)
$$

and

$$
z_{b}=\left(x(1)-b, x(2), \ldots, x\left(n_{0}-1\right), x\left(n_{0}\right)+b, x\left(n_{0}+1\right), \ldots\right) .
$$

It is easy to see that $\left\|y_{b}\right\|_{w, 1}=\left\|z_{b}\right\|_{w, 1}=1, z_{b} \neq y_{b}$ and $x=\left(y_{b}+z_{b}\right) / 2$. So, $x$ is not an extreme point, which is a contradiction. Thus we showed as required that if $n_{0}>1$, then $w(1)>w\left(n_{0}\right)$,

Now assume $x \in d(w, 1)$, and $n \in \mathbb{N}$ are such that $x(i)=1 / W(n)$ for $i=1, \ldots, n, x(i)=0$ for $i>n$ and $w(1)>w(n)$ if $n>1$. We shall show that $x$ is an extreme point of $B_{d(w, 1)}$. If $n=1$ this is an easy consequence of Lemma 2.4. Suppose that $n>1$. Let $x=(y+z) / 2$ with $\|y\|_{w, 1}=\|z\|_{w, 1}=1$ and $y \neq z$. By Lemma 2.4, $y(i)=z(i)=0$ for $i>n$. Indeed, if $y(i) \neq 0$ for some $i>n$, then $z(i)=-y(i)$. Defining $y^{1}=(y(1), \ldots y(n), 0, \ldots), z^{1}=(z(1), \ldots z(n), 0, \ldots)$, we have that $x=\left(y^{1}+z^{1}\right) / 2$. But by strict monotonicity, $\left\|z^{1}\right\|_{w, 1}<\|z\|_{w, 1}=1$ and $\left\|y^{1}\right\|_{w, 1}<\|y\|_{w, 1}=1$ and so $\|x\|_{w, 1}<1$; a contradiction. Define

$$
\begin{aligned}
& I_{1}=\{i=1, \ldots, n: y(i)>1 / W(n)\}, \\
& I_{2}=\{i=1, \ldots, n: y(i)=1 / W(n)\},
\end{aligned}
$$

and

$$
I_{3}=\{i=1, \ldots, n: y(i)<1 / W(n)\}
$$

By the strict monotonicity, we have $y, z \geq 0$. Otherwise, we can choose $\tilde{y}, \tilde{z}$ such that $|\tilde{y}|<|y|$, $|\tilde{z}|<|z|$ and $x=\frac{\tilde{y}+\tilde{z}}{2}$. Hence $\|\tilde{y}\|_{w, 1}<\|y\|_{w, 1}<1$ and $\|\tilde{z}\|_{w, 1}<\|z\|_{w, 1}<1$, which is a contradiction to the fact that $x=\frac{y+z}{2}$.

Let for $i=1,2,3, k_{i}=\operatorname{card} I_{i}$. Since $d(w, 1)$ is strictly monotone, $y \neq x$ and $\|y\|_{w, 1}=1$, so $k_{1}>0$ and $k_{3}>0$. Without loss of generality, permuting coordinates of $y$ and $z$, if necessary, we can assume that $y^{*}=y$. Since $\|y\|_{w, 1}=1$,

$$
y(1) w(1)+\cdots+y(n) w(n)=1
$$

By $\|z\|_{w, 1}=1$ and $x=(y+z) / 2$ we also have

$$
y(1) w(n)+\cdots+y(n) w(1)=1
$$

Moreover, by the assumption $w(1)>w(n)$, and by Hardy-Littlewood inequality, we have

$$
\begin{aligned}
1 & =y(1) w(1)+\cdots+y(n) w(n) \\
& >y(1) w(n)+y(n) w(1)+(y(2) w(2)+\ldots+y(n-1) w(n-1)) \\
& \geq y(1) w(n)+y(n) w(1)+(y(2) w(n-1)+\cdots+y(n-1) w(2)) \\
& =y(1) w(n)+\cdots+y(n) w(1)=1
\end{aligned}
$$

which is a contradiction. The proof is complete.

## 3. Applications

In this section we shall study the relationship between the existence and one-complemented subspaces of Lorentz space $d(w, 1)$, applying the characterization of smooth points in $d(w, 1)$ (Theorem 1.10) and extreme points in its dual $d^{*}(w, 1)$ (Theorem 2.2).

Let $X$ be a Banach space and let $C \subset X$ be a non-empty set. A continuous surjective mapping $P: X \rightarrow C$ is called a projection onto $C$, whenever $\left.P\right|_{C}=I d$, that is $P^{2}=P$.

Given a subspace $V$ of a Banach space $X$, by $P(X, V)$ we denote the set of all linear, bounded projections from $X$ onto $V$. Recall that a closed subspace $V$ of a Banach space $X$ is called one-complemented if there exists a norm one projection $P \in P(X, V)$. Setting for each $x \in X$,

$$
M_{C}(x)=\{z \in X:\|z-c\| \leq\|x-c\| \text { for any } c \in C\}
$$

it is clear that $x \in M_{C}(x)$ for every $x \in X$ and $M_{C}(c)=\{c\}$ for every $c \in C$. Letting Min $C$ be a subset of $X$ consisting an element $x$ such that $M_{C}(x)=\{x\}$, we say that $C \subset X$ is optimal if $\operatorname{Min} C=C$. Observe that for any $C \subset X, C \subset \operatorname{Min} C$.

This notion has been introduced by Beauzamy and Maurey in [3], where basic properties concerning optimal sets can be found.

A set $C \subset X$ is called an existence set of best coapproximation (existence set for brevity), if for any $x \in X, R_{C}(x) \neq \emptyset$, where

$$
\begin{equation*}
R_{C}(x)=\{d \in C:\|d-c\| \leq\|x-c\| \text { for any } c \in C\} \tag{3.1}
\end{equation*}
$$

It is clear that any existence set is an optimal set. The converse, in general, is not true. However, by [3, Prop. 2], if $X$ is one-complemented in $X^{* *}$ and strictly convex, then any optimal subset of $X$ is an existence set in $X$, which, in particular, holds true for strictly convex spaces $X$, such that $X=Z^{*}$ for some Banach space $Z$.

Existence and optimal sets have been studied by many authors from different points of view, mainly in the context of approximation theory and functional analysis (see e.g. [2, 3, 4, 5, 10, 12, $13,18,21,26]$ ). There is also a large literature concerning one-complemented subspaces (see e.g. a survey paper [24] and a recent paper [16]).

It is obvious that any one-complemented subspace is an existence set. However the converse, in general, is not true. By a deep result of Lindenstrauss [21] there exist a Banach space $X$ and a subspace $V$ of $X$, with $\operatorname{codim} V=2$, such that:
(a) $V$ is one-complemented in any $Y$, where $Y \supset V$ is a hyperplane in $X$ i.e $Y=f^{-1}(\{0\})$ for some $f \in X^{*} \backslash\{0\}$.
(b) $V$ is not one-complemented in $X$.

This fact together with the simple observation stated as Lemma 3.1 below, gives an example of a subspace being an existence set which is not one-complemented.
Lemma 3.1. Let $X$ be a Banach space and let $V \subset X, V \neq\{0\}$ be a linear subspace. Then $V$ is an existence set in $X$ if and only if for any $x \in X \backslash V$, there exists $P_{x} \in P\left(Z_{x}, V\right)$ with $\left\|P_{x}\right\|=1$. Here $Z_{x}=V \oplus[x]$, where $[x]$ denotes the linear span generated by $x$.

Proof. Assume that for any $x \in X \backslash V$ there exists $P_{x} \in P\left(Z_{x}, V\right),\left\|P_{x}\right\|=1$. Fix $z \in Z_{x}$ and $v \in V$. Note that

$$
\left\|P_{x} z-v\right\|=\left\|P_{x}(z-v)\right\| \leq\|z-v\| .
$$

Hence $P_{x} z \in R_{V}(z)$ and so $V$ is an existence set in $X$. Now assume that $V$ is an existence set in $X$ and fix $x \in X \backslash V$. Take any $d \in R_{V}(x)$. Since any $z \in Z_{x}$ can be uniquely expressed as $z=\alpha x+v$ for some $v \in V$ and $\alpha \in \mathbb{R}$, we can define $P_{x}: Z_{x} \rightarrow V$ by

$$
P_{x} z=\alpha d+v .
$$

It is easy to see that $P_{x} \in P\left(Z_{x}, V\right)$. To show that $\left\|P_{x}\right\|=1$, fix $y=\alpha x+v \in Z_{x}$, with $\alpha \neq 0$. Since $d \in R_{V}(x)$,

$$
\left\|P_{x} y\right\|=\|\alpha d+v\|=|\alpha|\|d+v / \alpha\| \leq \mid \alpha\|x+v / \alpha\|=\|\alpha x+v\|=\|y\|
$$

which completes the proof.
In [3] the following result has been proved.
Theorem 3.2. ([3], Prop. 5). Let $V \neq\{0\}$ be a linear subspace of a smooth, reflexive and strictly convex Banach space $X$. If $V$ is an optimal set then $V$ is one-complemented in $X$. If $X$ is a smooth Banach space, then any subspace of $X$ which is an existence set is one-complemented. Moreover, in both cases a norm-one projection from $X$ onto $V$ is uniquely determined.

We shall show here that the above result can be true in spaces that are not smooth. We will prove that any subspace of $d(w, 1)$ which is an existence set must be one-complemented, which cannot be deduced from Theorem 3.2 because by Theorem $1.10, d(w, 1)$ is not a smooth space. Just recently [20], a similar result has been proved for spaces $c_{0}, c, \ell_{1}$ and a large class of MusielakOrlicz sequence spaces equipped with the Luxemburg norm. These facts provide a partial answer to the question stated in [3], p. 125 concerning generalization of Theorem 3.2 to non-smooth case.

One of the main tools in our investigations, stated below, has been recently proved in [20].
Theorem 3.3. Let $X$ be a Banach space and let $V \subset X$, be a linear subspace. Assume that $V$ is an existence set and $V \neq\{0\}$. Put

$$
G_{V}=\left\{v \in V \backslash\{0\}: \text { there exists a unique } f \in S_{X^{*}}: f(v)=\|v\|\right\}
$$

Assume that the norm closure of $G_{V}$ in $X$ is equal to $V$. Then there exists a unique projection $P \in P(X, V)$ such that $\|P\|=1$. Consequently, $V$ is one-complemented in $X$.

For further reference we state the next well-known result.
Lemma 3.4. Let $X, Y$ be two Banach spaces, $V \subset X$ be a linear subspace and let $T: X \rightarrow Y$ be a linear isometry. Then $V$ is an existence set in $X$ if and only if $T(V)$ is an existence set in $T(X)$. Also $V$ is one-complemented in $X$ if and only if $T(V)$ is one complemented in $T(X)$.

For $n \in \mathbb{N}$ and a decreasing sequence of positive numbers $\{w(1), \ldots, w(n)\}$ define a finite dimensional Lorentz space

$$
d^{n}(w, 1)=\left(\mathbb{R}^{n},\|\cdot\|_{w, 1}\right)
$$

where

$$
\|x\|_{w, 1}=\sum_{j=1}^{n} x^{*}(j) w(j)
$$

Before we state the main result we shall prove several auxiliary lemmas.

Lemma 3.5. Let $\left\{C_{j}\right\}_{j \in \mathbb{N}}$ be a family of finite, nonempty subsets of $\mathbb{N}$ such that $C_{i} \cap C_{j}=\emptyset$ for $i \neq j$. Define for $j \in \mathbb{N}$

$$
X_{C_{j}}=\left\{x \in d(w, 1): x(i)=x(k) \text { for any } i, k \in C_{j}\right\}
$$

Let

$$
X_{C}=\bigcap_{j=1}^{\infty} X_{C_{j}} .
$$

Then $X_{C}$ is one-complemented in $d(w, 1)$. The same result applies to $d^{n}(w, 1)$. In this case we consider a finite family of nonempty, pairwise disjoint subsets of $\{1, \ldots, n\}$.

Proof. Let for $j \in \mathbb{N}, C_{j}=\left\{i_{1}, \ldots i_{k_{j}}\right\}$, where $k_{j}=\operatorname{card} C_{j}$.
Set for $x \in d(w, 1), j \in \mathbb{N}, P_{j} x=(z(1), \ldots, z(n), \ldots)$, where $z(i)=\left(\sum_{l \in C_{j}} x(l)\right) / k_{j}$ if $i \in C_{j}$, and $z(i)=x(i)$ in the opposite case. It is clear that $P_{j} \in P\left(d(w, 1), X_{C_{j}}\right)$. We also have that $\left\|P_{j}\right\|=1$. Indeed, since for any permutation $\sigma: \mathbb{N} \rightarrow \mathbb{N}$, the mapping $T_{\sigma}: d(w, 1) \rightarrow d(w, 1)$ given by $T_{\sigma} x=x \circ \sigma$ is a linear, surjective isometry of $d(w, 1)$. So by Lemma 3.4, we can assume that $C_{j}=\left\{1, \ldots, k_{j}\right\}$. Let $x \in S_{d(w, 1)}$, and set for $l=2, \ldots, k_{j}$

$$
x^{l}=\left(x(l), x(l+1), \ldots, x\left(k_{j}\right), x(1), \ldots, x(l-1), x\left(k_{j}+1\right), \ldots\right) .
$$

Then $x+\sum_{l=2}^{k_{j}} x^{l}=k_{j}\left(P_{j} x\right)$, and

$$
\left\|P_{j} x\right\|_{w, 1}=\left\|\left(x+\sum_{l=2}^{k_{j}} x^{l}\right) / k_{j}\right\|_{w, 1} \leq\left(\|x\|_{w, 1}+\sum_{l=2}^{k_{j}}\left\|x^{l}\right\|_{w, 1}\right) / k_{j}=1
$$

since $\left\|x^{l}\right\|_{w, 1}=\|x\|_{w, 1}=1$ for $l=2, \ldots, k_{j}$. Thus $\left\|P_{j}\right\|=1$. Now define for $j \in \mathbb{N}$

$$
X_{j}=\bigcap_{m=1}^{j} X_{C_{m}}
$$

and

$$
Q_{j}=P_{1} \circ P_{2} \circ \cdots \circ P_{j} .
$$

Since $C_{i} \cap C_{k}=\emptyset$, for $i \neq k$, so $Q_{j} \in P\left(d(w, 1), X_{j}\right)$. By the above reasoning, $\left\|Q_{j}\right\|=1$.
Now, fix $x \in d(w, 1)$. Define $Q x=((Q x)(1), \ldots(Q x)(n), \ldots)$, where $(Q x)(i)=x(i)$ if $i \notin \bigcup_{j \in \mathbb{N}} C_{j}$ and $\left.(Q x)(i)=\sum_{l \in C_{j}} x(l)\right) / k_{j}$ if $i \in C_{j}$. Since $C_{i} \cap C_{j}=\emptyset$ for $i \neq j$,

$$
(Q x)(i)=\lim _{j}\left(Q_{j} x\right)(i)
$$

for any $i \in \mathbb{N}$. Now we show that $Q x \in d(w, 1)$ for any $x \in d(w, 1)$. Indeed, for any $x \in B_{d(w, 1)}$ and any $j \in \mathbb{N}$, we have $\left\|Q_{j} x\right\| \leq 1$ since $\left\|Q_{j}\right\|=1$. In view of $d(w, 1)=\left(d_{*}(w, 1)\right)^{*}$, and the fact that $d_{*}(w, 1)$ is separable, the weak* topology on $B_{d(w, 1)}$ is metrizable. Thus by the Banach - Alaoglu theorem, there exists a subsequence $\left\{j_{k}\right\}$ and $R x \in B_{d(w, 1)}$, with $Q_{j_{k}} x \rightarrow R x$ weakly* in $d(w, 1)$. In particular for any $i \in \mathbb{N}$ we have

$$
(R x)(i)=\lim _{k}\left(Q_{j_{k}} x\right)(i) .
$$

This shows that $Q x=R x$, and consequently $Q x \in d(w, 1)$. Note also that $Q x \in X_{C}$ and for any $x \in X_{C}, Q x=x$. Since $Q x=R x, Q x \in B_{d(w, 1)}$, for any $x \in B_{d(w, 1)}$. Thus $Q$ is a linear projection from $d(w, 1)$ onto $X_{C}$ with $\|Q\|=1$, which completes the proof. The case of $d^{n}(w, 1)$ can be proved in the similar way.

The next lemma is well-known but for the sake of completeness we include its proof here.
Lemma 3.6. Let $X$ be a Banach space and let $x \in X$. Define

$$
D(x)=\left\{f \in B_{X^{*}}: f(x)=\|x\|\right\} .
$$

Then

$$
\emptyset \neq \operatorname{ext} D(x) \subset \operatorname{ext} B_{X^{*}}
$$

Proof. If $x=0$, then $D(x)=B_{X^{*}}$ which shows our claim. So assume $x \neq 0$. By the Hahn-Banach Theorem, $D(x) \neq \emptyset$. Note that $D(x)$ is a convex, weakly* closed subset of $B_{X}$. By the BanachAlaoglu and the Krein-Milman Theorems, ext $D(x) \neq \emptyset$. We show that ext $D(x) \subset \operatorname{ext} B_{X^{*}}$. Let $f \in \operatorname{ext} D(x)$. Assume $f=\left(f_{1}+f_{2}\right) / 2$ and $f_{1}, f_{2} \in S_{X^{*}}$. Hence

$$
\|x\|=f(x)=\left(f_{1}(x)+f_{2}(x)\right) / 2
$$

Since $\left\|f_{1}\right\|=\left\|f_{2}\right\|=1, f_{1}(x)=f_{2}(x)=\|x\|$, which gives $f_{1}, f_{2} \in D(x)$. Since $f \in \operatorname{ext} D(x)$, $f_{1}=f_{2}$, as required.

Lemma 3.7. Let $v \in d(w, 1) \backslash\{0\}$ be such that $v=v^{*}$ and $\operatorname{card}(\operatorname{supp} v)=\infty$. Let

$$
D_{1}=\{k \in \mathbb{N}: v(1)=v(k)\} \quad \text { and } \quad n_{1}=\max D_{1}
$$

For $i \geq 2$, let

$$
D_{i}=\left\{k \in \mathbb{N}: v\left(n_{i-1}+1\right)=v(k)\right\} \quad \text { and } \quad n_{i-1}=\max D_{i-1}
$$

Set

$$
E(v)=\left\{f \in \operatorname{ext} B_{d^{*}(w, 1)}: f(v)=\|v\|_{w, 1}\right\} .
$$

Then $f \in E(v)$ if and only if $f=w \circ \sigma$, where $\sigma: \mathbb{N} \rightarrow \mathbb{N}$ is a permutation such that for any $k \in D_{i}$ and $l \in D_{i+1}$ we have $w(\sigma(k)) \geq w(\sigma(l))$ and

$$
\sum_{k \in D_{i}} w(\sigma(k))=\sum_{k \in D_{i}} w(k)
$$

for any $i \in \mathbb{N}$.
Proof. Assume $f \in E(v)$. Since $v=v^{*}$ and $\operatorname{card}(\operatorname{supp}(v))=\infty$, by Theorem 2.2, $f=w \circ \sigma$ for some permutation $\sigma: \mathbb{N} \rightarrow \mathbb{N}$. Assume on the contrary, that there exist $i \in \mathbb{N}, k \in D_{i}$ and $l \in D_{i+1}$, with $w(\sigma(k))<w(\sigma(l))$. Define $\sigma_{1}: \mathbb{N} \rightarrow \mathbb{N}$ by $\sigma_{1}(l)=\sigma(k), \sigma_{1}(k)=\sigma(l)$ and $\sigma_{1}(n)=\sigma(n)$ for $n \notin\{k, l\}$. Since $v(k)>v(l)$, and $w(\sigma(k))<w(\sigma(l))$,

$$
\|v\|_{w, 1}=\sum_{j=1}^{\infty} v(j) w(\sigma(j))=f(v)<\sum_{j=1}^{\infty} v(j) w\left(\sigma_{1}(j)\right)
$$

which is a contradiction. Now, applying the induction argument, we show that

$$
\sum_{k \in D_{i}} w(\sigma(k))=\sum_{k \in D_{i}} w(k)
$$

for any $i \in \mathbb{N}$.
Let

$$
Z_{1}=\{j \in \mathbb{N}: w(j)=w(1)\}
$$

$m_{1}=\max Z_{1}$ and for $i \geq 2$

$$
Z_{i}=\left\{j \in \mathbb{N}: w(j)=w\left(m_{i-1}+1\right)\right\}
$$

where $m_{i}=\max Z_{i}$. If $D_{1} \subset Z_{1}$, then $\sigma\left(D_{1}\right) \subset Z_{1}$, since $f(v)=\|v\|_{w, 1}$. Consequently, since $\operatorname{card}\left(\sigma\left(D_{1}\right)\right)=n_{1}$,

$$
\sum_{i \in D_{1}} w(i)=n_{1} w(1)=\sum_{i \in D_{1}} w(\sigma(i))
$$

as required. If $m_{1}<n_{1}$, there is $i_{0} \geq 2$ such that

$$
D_{1}=Z_{1} \cup \cdots \cup Z_{i_{0}-1} \cup\left(Z_{i_{0}} \cap D_{1}\right) .
$$

Since $f(v)=\|v\|_{w, 1}, Z_{j} \subset \sigma\left(D_{1}\right)$ for any $j \leq i_{0}-1$ and

$$
\sigma\left(D_{1}\right) \subset Z_{1} \cup \cdots \cup Z_{i_{0}}
$$

Hence

$$
\sigma\left(D_{1}\right)=Z_{1} \cup \cdots Z_{i_{0}-1} \cup\left(Z_{i_{0}} \cap \sigma\left(D_{1}\right)\right)
$$

and

$$
\sum_{k \in D_{1}} w(\sigma(k))=\sum_{k \in D_{1}} w(k) .
$$

Now assume that

$$
\sum_{k \in D_{i}} w(\sigma(k))=\sum_{k \in D_{i}} w(k)
$$

for $i \leq u-1$. We will show that

$$
\sum_{k \in D_{u}} w(\sigma(k))=\sum_{k \in D_{u}} w(k) .
$$

First we show that for any $j \in D_{u}$,

$$
\begin{equation*}
w\left(n_{u-1}\right) \geq w(\sigma(j)) \geq w\left(n_{u}+1\right) \tag{3.2}
\end{equation*}
$$

where for $k \in \mathbb{N} n_{k}=\max D_{k}$. By the induction hypothesis, there exists $l \in \bigcup_{i=1}^{u-1} D_{i}$ with $w(\sigma(l))=w\left(n_{u-1}\right)$. Hence by the first part of the proof,

$$
w\left(n_{u-1}\right)=w(\sigma(l)) \geq w(\sigma(j))
$$

If there exists $j \in D_{u}$ with $w(\sigma(j))<w\left(n_{u}+1\right)$, then $\bigcup_{i=1}^{u} D_{i} \backslash \sigma\left(\bigcup_{i=1}^{u} D_{i}\right) \neq \emptyset$. Since $\sigma$ is a permutation there exists $l>n_{u} \geq j$ with $w(\sigma(l)) \geq w\left(n_{u}\right)>w(\sigma(j))$. Since $f(v)=\|v\|_{w, 1}$, this leads to a contradiction.
Now $J_{u}=\left\{j \in \mathbb{N}: Z_{j} \subset D_{u}\right\}$. We show that for any $j \in J_{u}, Z_{j} \subset \sigma\left(D_{u}\right)$. Fix $j \in J_{u}$. Since $w\left(n_{u-1}\right)>w(\sigma(k))$ for any $k \in \sigma^{-1}\left(Z_{j}\right)$, and $f(v)=\|v\|_{w, 1} Z_{j} \subset \bigcup_{i=u}^{\infty} \sigma\left(D_{i}\right)$. If $Z_{j} \backslash \sigma\left(D_{u}\right) \neq \emptyset$, there exists $l>n_{u}$ with $w(\sigma(l)) \geq w\left(n_{u}\right)$ and $k \leq n_{u}$ with $w(\sigma(k))<w\left(n_{u}\right)$; a contradiction with the first part of the proof. Now let set

$$
\begin{aligned}
& B_{u}=\left\{Z_{j}: Z_{j} \cap D_{u-1} \neq \emptyset \text { and } Z_{j} \cap D_{u} \neq \emptyset,\right\} \\
& F_{u}=\left\{Z_{j}: Z_{j} \cap D_{u} \neq \emptyset \text { and } Z_{j} \cap D_{u+1} \neq \emptyset,\right\}
\end{aligned}
$$

Since $w(n)$ is decreasing $B_{u}$ ( $F_{u}$ resp. $)=\emptyset$ or $B_{u}=\left\{Z_{i_{0}}\right\}\left(F_{u}=\left\{Z_{j_{0}}\right\}\right.$ resp.). If $D_{u} \subset Z_{i_{0}}$ or $D_{u} \subset Z_{j_{0}}$, then $J_{u}=\emptyset$. Since $f(v)=\|v\|_{w, 1}, \sigma\left(D_{u}\right) \subset Z_{i_{0}}$ or $\sigma\left(D_{u}\right) \subset Z_{j_{0}}$. By (3.2) $w(\sigma(k))=$ $w\left(n_{u-1}+1\right)$ for any $k \in \sigma^{-1}\left(Z_{i_{0}}\right)$ or for any $k \in \sigma^{-1}\left(Z_{j_{0}}\right)$. Hence

$$
\sum_{k \in D_{u}} w(k)=\operatorname{card}\left(D_{u}\right) w\left(n_{u-1}+1\right)=\sum_{k \in D_{u}} w(\sigma(k)) .
$$

If $B_{u}=\left\{Z_{i_{0}}\right\}$ and $F_{u}=\left\{Z_{j_{0}}\right\}$ then by the induction hypothesis $\operatorname{card}\left(\sigma\left(Z_{i_{0}}\right) \cap D_{u}\right)=\operatorname{card}\left(Z_{i_{0}} \cap D_{u}\right)$. If $J_{u} \neq \emptyset$, then for any $j \in J_{u} \operatorname{card}\left(Z_{j}\right)=\operatorname{card}\left(Z_{j} \cap D_{u}\right)=\operatorname{card}\left(\sigma\left(D_{u}\right) \cap Z_{j}\right)$, since $Z_{j} \subset \sigma\left(D_{u}\right)$. Since $\operatorname{card}\left(D_{u}\right)=\operatorname{card}\left(\sigma\left(D_{u}\right)\right)$, also $\operatorname{card}\left(Z_{j_{0}} \cap D_{u}\right)=\operatorname{card}\left(\sigma\left(Z_{j_{0}}\right) \cap D_{u}\right)$. Note that

$$
\begin{aligned}
\sum_{i \in D_{u}} w(i) & =\operatorname{card}\left(Z_{i_{0}} \cap D_{u}\right) w\left(n_{u-1}+1\right)+\sum_{j \in J_{u}} \operatorname{card}\left(Z_{j}\right) w\left(m_{j}\right) \\
& +\operatorname{card}\left(Z_{j_{0}} \cap D_{u}\right) w\left(n_{u}\right) \\
& =\operatorname{card}\left(\sigma\left(Z_{i_{0}}\right) \cap D_{u}\right) w\left(n_{u-1}+1\right)+\sum_{j \in J_{u}} \operatorname{card}\left(\sigma\left(D_{u}\right) \cap Z_{j}\right) w\left(m_{j}\right) \\
& +\operatorname{card}\left(\sigma\left(Z_{j_{0}}\right) \cap D_{u}\right) w\left(n_{u}\right)=\sum_{i \in D_{u}} w(\sigma(i))
\end{aligned}
$$

If $\left(B_{u}=\emptyset\right.$ or $\left.F_{u}=\emptyset\right)$ and $J_{u} \neq \emptyset$, then reasoning as above we get that

$$
\sum_{i \in D_{u}} w(i)=\sum_{i \in D_{u}} w(\sigma(i))
$$

which shows our claim. In order to prove the converse, note that

$$
\begin{aligned}
\|v\|_{w, 1} & =\sum_{n=1}^{\infty} w(n) v(n)=\sum_{i \in \mathbb{N}} v\left(n_{i}\right) \sum_{j \in D_{i}} w(j) \\
& =\sum_{i \in \mathbb{N}} v\left(n_{i}\right) \sum_{j \in D_{i}} w(\sigma(j))=\sum_{n=1}^{\infty} v(n) w(\sigma(n)) .
\end{aligned}
$$

Thus the proof is complete.

Lemma 3.8. Let $V \subset d(w, 1)$ be a linear subspace. Set

$$
G_{V}=\left\{v \in V \backslash\{0\}: \text { there exists a unique } f \in S_{V^{*}}: f(v)=\|v\|_{w, 1}\right\}
$$

and for any $k \in \mathbb{N}$, let

$$
C_{k}=\{j \in \mathbb{N}: x(j)=x(k) \text { for any } x \in V\}
$$

Let $D_{i}$ and $Z_{j}$ be such as in Lemma 3.7. If $v \in G_{V}$ is such that $v=v^{*}$ and $\operatorname{card}(\operatorname{supp} v)=\infty$, and $i \in \mathbb{N}$ is such that $D_{i} \backslash Z_{j} \neq \emptyset$ for any $j \in \mathbb{N}$, then $D_{i}=C_{k}$ for some $k \in \mathbb{N}$.

Proof. Since $D_{i} \backslash Z_{j} \neq \emptyset$ for any $j \in \mathbb{N}$, there exists $k \in D_{i}, k+1 \in D_{i}$ with $w(k)>w(k+1)$. We show that $C_{k}=D_{i}$. Indeed, the inclusion $C_{k} \subset D_{i}$ is obvious by definition of $C_{k}$ and $D_{i}$. In order to show the opposite inclusion, assume on the contrary that there exists $l \in D_{i} \backslash C_{k}$. If $l \geq k+1$, define for $x \in d(w, 1)$

$$
\begin{aligned}
& h_{1}(x)=\sum_{m=1}^{\infty} x(m) w(m) \\
& h_{2}(x)=\sum_{m \neq l, k}^{\infty} x(m) w(m)+x(k) w(l)+x(l) w(k)
\end{aligned}
$$

Note that $h_{1}(v)=h_{2}(v)=\|v\|_{w, 1}$. Since $l \notin C_{k}$ and $k \in C_{k}$, there exists $z \in V$ such that $z(k) \neq z(l)$. We have

$$
h_{1}(z)-h_{2}(z)=z(k)(w(k)-w(l))+z(l)(w(l)-w(k))=(w(k)-w(l))(z(k)-z(l)) .
$$

It follows that $h_{1}(z) \neq h_{2}(z)$ since $w(k)>w(k+1) \geq w(l)$ and $z(k) \neq z(l)$. Thus $h_{1} \neq h_{2}$ on $V$ and so $v \notin G_{V}$; a contradiction. If $l<k$, consider $g_{1}, g_{2} \in d^{*}(w, 1)=(d(w, 1))^{*}$ defined by:

$$
\begin{aligned}
& g_{1}(x)=\sum_{m=1}^{\infty} x(m) w(m) \\
& g_{2}(x)=\sum_{m \neq i, k}^{\infty} x(m) w(m)+x(l) w(k+1)+x(k+1) w(l)
\end{aligned}
$$

Note that $g_{1}(v)=g_{2}(v)=\|v\|_{w, 1}$. Since $l \notin C_{k}$ and by the above proof $k+1 \in C_{k}$, there exists $y \in V$ such that $y(l) \neq y(k+1)$. By the following equality

$$
\begin{aligned}
g_{1}(y)-g_{2}(y) & =y(l)(w(l)-w(k+1))+y(k+1)(w(k+1)-w(l)) \\
& =(w(l)-w(k+1))(y(l)-y(k+1)),
\end{aligned}
$$

and in view of $w(l) \geq w(k)>w(k+1)$ and $y(l) \neq y(k+1)$, we have that $g_{1}(y) \neq g_{2}(y)$. Thus $v \notin G_{V} ;$ a contradiction. Thus the sets $D_{i}$ and $C_{k}$ coincide.

Now we are able to state the main result of this section.
Theorem 3.9. Let $V \subset d(w, 1), V \neq\{0\}$ be a linear subspace. If $V$ is an existence set then $V$ is one-complemented.

Proof. Let

$$
\operatorname{supp} V=\bigcup_{v \in V} \operatorname{supp} v
$$

First we assume that $\operatorname{card}(\operatorname{supp} V)=\infty$. For any $i \in \mathbb{N}$ define

$$
\begin{gathered}
C_{i, 1}=\{j \in \mathbb{N}, j \neq i: x(i)=x(j) \text { for any } x \in V\} \\
C_{i, 2}=\{j \in \mathbb{N}, j \neq i: x(i)=-x(j) \text { for any } x \in V\}
\end{gathered}
$$

and

$$
C_{i}=\{i\} \cup C_{i, 1} \cup C_{i, 2} .
$$

Note that for any $i \neq j, C_{i}=C_{j}$ or $C_{i} \cap C_{j}=\emptyset$. Since $d(w, 1) \subset c_{0}$ and $\operatorname{card}(\operatorname{supp} V)=\infty, C_{i}$ is a finite, nonempty set for any $i \in \mathbb{N}$. Set $i_{1}=1, i_{2}=\min \left\{\mathbb{N} \backslash C_{i_{1}}\right\}$ and $i_{n}=\min \left\{\mathbb{N} \backslash \bigcup_{j=1}^{n-1} C_{i_{j}}\right\}$. Note that $\mathbb{N}=\bigcup_{j=1}^{\infty} C_{i_{j}}$ and $C_{i_{j}} \cap C_{i_{k}}=\emptyset$ for $j \neq k$. Since for any permutation $\sigma: \mathbb{N} \rightarrow \mathbb{N}$ and $\{\epsilon(n)\}$ with $\epsilon(n)= \pm 1$, the mapping $T x=\{\epsilon(n) x(\sigma(n))\}$ is a linear, surjective isometry of $d(w, 1)$,
in view of Lemma 3.4, we can assume without loss of generality that $C_{i_{j}, 2}=\emptyset$ for any $j \in \mathbb{N}$. For simplicity we shall further denote the sets $\left\{C_{i_{j}}\right\}$ by $\left\{C_{i}\right\}$. Let $X_{C}$ be the space considered in Lemma 3.5, generated by the sets $C_{i}$ defined above. By Lemma 3.5, $X_{C}$ is one-complemented in $d(w, 1)$. By the construction of the sets $C_{i}$, and Lemma 3.4, we can assume that $V \subset X_{C}$ for modified sets $C_{i}$. Thus in order to show that $V$ is one-complemented in $d(w, 1)$, it is enough to demonstrate that $V$ is one-complemented in $X_{C}$. We will apply Theorem 3.3. Let

$$
G_{V}=\left\{v \in V \backslash\{0\}: \text { there exists a unique } f \in S_{V^{*}}: f(v)=\|v\|_{w, 1}\right\}
$$

and

$$
G_{V, C}=\left\{v \in V \backslash\{0\}: \text { there exists a unique } f \in S_{\left(X_{C}\right)^{*}}: f(v)=\|v\|_{w, 1}\right\}
$$

We shall show that $G_{V}=G_{V, C}$. Note that by the Hahn-Banach Theorem, $G_{V, C} \subset G_{V}$. To prove the converse, assume that $v \in G_{V}$. We need to show that $v$ is a smooth point in $X_{C}$.

Note also that $\operatorname{card}(\operatorname{supp} v)=\infty$. Indeed, if we assume that $\operatorname{supp} v=\{1, \ldots, n\}$, then in view of $\operatorname{card}(\operatorname{supp} V)=\infty$, there exist $j>n$ and $y \in V$ with $y(j) \neq 0$. Defining for $x \in d(w, 1)$

$$
f_{1}(x)=\sum_{m=1}^{\infty} x(m) w(m)
$$

and

$$
f_{2}(x)=f_{1}(x)-2 x(j) w(j),
$$

we have $f_{1}(v)=f_{2}(v)=\|v\|_{w, 1}$ and $\left|f_{i}(x)\right| \leq\|x\|_{w, 1}, i=1,2$, by the Hardy inequality. Thus $\left\|\left.f_{1}\right|_{V}\right\|=\left\|\left.f_{2}\right|_{V}\right\|=1$. Since also $f_{1}(y) \neq f_{2}(y)$, so $v \notin G_{V}$; a contradiction. Thus supp $v$ is infinite. Let

$$
E(v, C)=\left\{f \in \operatorname{ext} B_{\left(X_{C}\right)^{*}}: f(v)=\|v\|_{w, 1}\right\}
$$

By Lemma 3.6 applied to $v$ and $X_{C}, E(v, C) \neq \emptyset$. We shall show that $\operatorname{card} E(v, C)=1$. Recall that

$$
E(v)=\left\{f \in \operatorname{ext} B_{d^{*}(w, 1)}: f(v)=\|v\|_{w, 1}\right\}
$$

We have the following inclusion

$$
\left.E(v, C) \subset E(v)\right|_{X_{C}}=\left\{\left.h\right|_{X_{C}}: h \in E(v)\right\}
$$

Indeed, let $g \in S_{V^{*}}$ such that $g(v)=\|v\|_{w, 1}$. Since $v \in G_{V}, g$ is uniquely determined, $g \in \operatorname{ext} B_{V^{*}}$ and thus for any $f \in E(v, C),\left.f\right|_{V}=g$. Hence

$$
E(v, C)=\left\{f \in \operatorname{ext} B_{\left(X_{C}\right)^{*}}:\left.f\right|_{V}=g\right\}
$$

and

$$
E(v)=\left\{h \in \operatorname{ext} B_{d^{*}(w, 1)}:\left.h\right|_{V}=g\right\} .
$$

If $f \in E(v, C)$ then the set of all norm preserving extensions of $f$ to $d(w, 1)$ is denoted by

$$
G(f)=\left\{h \in B_{d^{*}(w, 1)}:\left.h\right|_{X_{C}}=f\right\}
$$

Since $G(f)$ is non-empty and weakly* compact, by the Krein-Milman Theorem ext $G(f) \neq \emptyset$. It is clear that for any $h \in \operatorname{ext} G(f),\left.h\right|_{X_{C}}=f$ and $\left.h\right|_{V}=g$, which shows the required inclusion.

Now we claim that for any $h \in E(v)$, and $x \in X_{C}$

$$
h(x)=\sum_{n=1}^{\infty} w(n) x(n) .
$$

In fact, by Lemma 3.7, $h=w \circ \sigma$, where the permutation $\sigma$ is such that for any $i \in \mathbb{N}$

$$
\sum_{j \in D_{i}} w(j)=\sum_{j \in D_{i}} w(\sigma(j))
$$

and $D_{i}$ are such as in Lemma 3.7. Therefore, it is enough to demonstrate that for any $i \in \mathbb{N}$ and any $x \in X_{C}$

$$
\sum_{j \in D_{i}} x(j) w(j)=\sum_{j \in D_{i}} x(j) w(\sigma(j))
$$

Fix $i \in \mathbb{N}$. If $D_{i} \subset Z_{j}$ for some $j \in J_{i}$ (see Lemma 3.7) then for any $k \in D_{i}$

$$
w(k)=w\left(m_{j}\right)=w(\sigma(k))
$$

Hence

$$
\sum_{j \in D_{i}} x(j) w(j)=w\left(m_{j}\right) \sum_{j \in D_{i}} x(j)=\sum_{j \in D_{i}} x(j) w(\sigma(j))
$$

If $Z_{j} \backslash D_{i} \neq \emptyset$ for any $j \in \mathbb{N}$, then by Lemma $3.8, D_{i}=C_{k}$ for some $k \in \mathbb{N}$, and in view of Lemma 3.7 we get

$$
\begin{aligned}
\sum_{j \in D_{i}} x(j) w(j) & =\sum_{j \in C_{k}} x(j) w(j)=x\left(n_{i}\right) \sum_{j \in D_{i}} w(i) \\
& =x\left(n_{i}\right) \sum_{j \in D_{i}} w(\sigma(i))=\sum_{j \in D_{i}} x(j) w(\sigma(j))
\end{aligned}
$$

which shows our claim. Thus $\left.E(v)\right|_{X_{C}}$ consists of exactly one element and consequently card $E(v, C)=$ 1 , since $\left.E(v, C) \subset E(v)\right|_{X_{C}}$ and $E(v, C)$ is nonempty.

By Lemma 3.6, $v$ is a smooth point in $X_{C}$ and consequently $v \in G_{V, C}$. Thus $G_{V}=G_{V, C}$. Since $V$ is an existence set in $d(w, 1)$ and $V \subset X_{C} \subset d(w, 1), V$ is an existence set in $X_{C}$. Moreover, by separability of $d(w, 1)$ and by the Mazur Theorem [11, Theorem 4.12], that the collection of smooth points in a separable Banach space $X$ is dense in $X, G_{V}$ is dense in $X_{C}$. Applying now Theorem 3.3 to $V$ and $X_{C}$, there exists a norm-one projection $P \in P\left(X_{C}, V\right)$. In view of Lemma 3.5 we can also find a norm-one projection $Q \in P\left(d(w, 1), X_{C}\right)$. Hence $R=P \circ Q$ is a norm-one projection from $d(w, 1)$ onto $V$. The proof is complete in the case when $\operatorname{supp} V$ is infinite.

If supp $V$ is a finite set, by Lemma 3.4, we can assume that $\operatorname{supp} V=\{1, \ldots, n\}$ for some $n \in \mathbb{N}$. In this case we can consider $V$ as a subspace of $d^{n}(w, 1)$. Since $V$ is an existence set in $d(w, 1), V$ is also an existence set in $d^{n}(w, 1)$. Reasoning as above we can show that $V$ is one-complemented in $d^{n}(w, 1)$. Since the norm in $d(w, 1)$ is monotone, the mapping

$$
Q x=(x(1), \ldots x(n), 0, \ldots)
$$

is a norm-one projection from $d(w, 1)$ onto $d^{n}(w, 1)$. Hence $V$ is one-complemented in $d(w, 1)$, as required.
